

Assignment Breakdown

Part 1 — Build a Loan Application Dashboard (Core Feature)

Build a single-page Loan Application Tracker with the following screens/views:

1a. Application List View

- Fetch and display a list of loan applications from the mock API endpoint below
- Each card must show: Applicant Name, Loan Amount, Loan Type (Personal / Business / Home), Status (Pending / Under Review / Approved / Rejected), and Applied Date
- Implement **client-side filtering** by Status and Loan Type
- Implement **sorting** by Loan Amount and Applied Date
- Show a **summary strip** at the top: total applications, total amount in pipeline, approval rate (%)

1b. Application Detail View

- Clicking a card opens a detail view (modal or side panel — your choice, justify it)
- Show all application fields plus a mock credit score gauge (visual, not functional)
- Include a **Status Update** dropdown (UI only, no API call needed) with a confirmation step before applying

1c. Empty & Error States

- Handle loading, empty results, and API error states explicitly — not just a spinner

create a local `db.json` with `json-server`, or simply mock the data inline with a realistic dataset of at least 15 records. I

****Sample record shape:****

json

```
{  
  "id": "LA-2024-0041",  
  "applicantName": "Priya Sharma",  
  "loanType": "Personal",  
  "amount": 450000,  
  "status": "Under Review",  
  "appliedDate": "2024-11-03",  
  "creditScore": 724,  
  "assignedTo": "Rahul Menon",  
  "remarks": "Salary slips pending"  
}
```

Part 2 -

Create Below Figma screens -

Add some dummy data consuming from any excel or any local DB
